Background:

Approximately 80% of hemodialysis patients in the US initiate dialysis with a central venous catheter (CVC) despite their high incidence of infections compared to other vascular access modalities.¹

End-stage renal disease (ESRD) patients with CVCs have a higher rate of sepsis infections of 2.32 per patient year compared to arteriovenous grafts (AVGs) at .61 per patient year.¹

Sepsis hospitalizations have been cited as the costliest condition to treat in the US.²

ESRD patients hospitalized for sepsis related to CVCs cost an average of $27,088 per admission and have an in-hospital mortality rate of 7.6%.³

Objective:

We compare CVC sepsis costs for patients implanted with the early cannulation GORE® ACUSEAL Vascular Graft to patients with non-early cannulation AVGs (ecAVGs).

Methods:

An economic cost model was estimated using the GORE® ACUSEAL Vascular Graft clinical study,⁴ clinical literature for the non-ecAVG, and publicly available cost sources.

The GORE® ACUSEAL Vascular Graft clinical study was a prospective, multi-center, single-arm study to establish the safety and efficacy of the GORE® ACUSEAL Vascular Graft for use in hemodialysis access (Table 1).

Economic value of preventing central venous catheter sepsis infections with early cannulation arteriovenous grafts (ecAVGs) compared to non-ecAVGs

Mohr BA, Trovillion PJ
W. L. Gore & Associates, Inc., Flagstaff, AZ

The GORE® ACUSEAL Vascular Graft can be cannulated within 24 hours of implantation. Approximately 22% of the GORE® ACUSEAL Vascular Grafts were cannulated within 24 hours, and 52% of the GORE® ACUSEAL Vascular Grafts were cannulated within 1 week of the implant procedure (Figure 1).

Note: Estimates calculated from 135 subjects.

The study collected data on the first three consecutive hemodialysis sessions as a surrogate endpoint for time to potential CVC removal.

The median days to potential CVC removal was 15.5 in the study compared to a combined average of 34 days for non-ecAVGs from Quinn et al and Shingarev et al which is an increase of 18.5 catheter-dependent days as compared to GORE® ACUSEAL Vascular Grafts.⁵ ⁶

The CVC sepsis rate of 2.32 per patient-year was obtained from the US Renal Data System.¹

The CVC sepsis hospitalization cost was calculated as $27,088 from the Healthcare Cost and Utilization Project 2010 Nationwide Inpatient Sample and converted to 2014 dollars using the Medical Consumer Price Index.¹ ⁷

- Hospitalization costs were estimated using a combination of ICD-9-CM diagnosis codes to determine the costs for hospitalization of specific ESRD CVC patients with sepsis.

- Hospital admissions with a primary diagnosis code of 999.31-infection due to CVC with secondary diagnosis codes, 585.6-ESRD, and 995.91-sepsis and / or 995.92-severe sepsis, were used to determine the appropriate patient population.
The estimated average CVC sepsis costs in the GORE® ACUSEAL Vascular Graft group were $2,682 per patient versus $5,851 per patient in the non-ecAVG group, resulting in a cost savings of $3,169 per patient (Figure 2).

**Conclusion:**

It is estimated the GORE® ACUSEAL Vascular Graft reduces the overall incidence of CVC sepsis and related costs compared to non-ecAVGs due to fewer CVC-dependent days.

As clinicians become more accustomed to cannulating the GORE® ACUSEAL Vascular Graft within 24 hours, the cost savings could potentially be higher than what is currently estimated.
